HETEROCYCLIC CGRP ANTAGONISTS FOR THE TREATMENT OF MIGRAINE

5

FIELD OF THE INVENTION

10 The present invention relates to novel small molecule antagonists of calcitonin gene-related peptide receptors ("CGRP-receptor"), pharmaceutical compositions comprising them, methods for identifying them, methods of treatment using them and their use in therapy for treatment of neurogenic vasodilation, neurogenic inflammation, migraine, cluster headache and other
15 headaches, thermal injury, circulatory shock, flushing associated with menopause, airway inflammatory diseases, such as asthma and chronic obstructive pulmonary disease (COPD), and other conditions the treatment of which can be effected by the antagonism of CGRP-receptors.

20

BACKGROUND OF THE INVENTION

 Calcitonin gene-related peptide (CGRP) is a naturally occurring 37-amino-acid peptide first identified in 1982 (Amara, S. G. et al, *Science* 1982, 298, 240-244). Two forms of the peptide are expressed (α CGRP and β CGRP) which differ by one and three amino acids in rats and humans, respectively. The peptide
25 is widely distributed in both the peripheral (PNS) and central nervous system (CNS), principally localized in sensory afferent and central neurons, and displays a number of biological effects, including vasodilation.

 When released from the cell, CGRP binds to specific cell surface G protein-coupled receptors and exerts its biological action predominantly by
30 activation of intracellular adenylate cyclase (Poyner, D. R. et al, *Br J Pharmacol* 1992, 105, 441-7; Van Valen, F. et al, *Neurosci Lett* 1990, 119, 195-8.). Two

- 2 -

classes of CGRP receptors, CGRP₁ and CGRP₂, have been proposed based on the antagonist properties of the peptide fragment CGRP(8–37) and the ability of linear analogues of CGRP to activate CGRP₂ receptors (Juaneda, C. et al. *TiPS* 2000, 21, 432-438). However, there is lack of molecular evidence for the CGRP₂ receptor (Brain, S. D. et al, *TiPS* 2002, 23, 51-53). The CGRP₁ receptor has three components: (i) a 7 transmembrane calcitonin receptor-like receptor (CRLR); (ii) the single transmembrane receptor activity modifying protein type one (RAMP1); and (iii) the intracellular receptor component protein (RCP) (Evans B. N. et al., *J Biol Chem.* 2000, 275, 31438-43). RAMP1 is required for transport of CRLR to the plasma membrane and for ligand binding to the CGRP-receptor (McLatchie, L. M. et al, *Nature* 1998, 393, 333-339). RCP is required for signal transduction (Evans B. N. et al., *J Biol Chem.* 2000, 275, 31438-43). There are known species-specific differences in binding of small molecule antagonists to the CGRP-receptor with typically greater affinity seen for antagonism of the human receptor than for other species (Brain, S. D. et al, *TiPS* 2002, 23, 51-53). The amino acid sequence of RAMP1 determines the species selectivity, in particular, the amino acid residue Trp74 is responsible for the phenotype of the human receptor (Mallee et al. *J Biol Chem* 2002, 277, 14294-8).

Inhibitors at the receptor level to CGRP are postulated to be useful in pathophysiologic conditions where excessive CGRP receptor activation has occurred. Some of these include neurogenic vasodilation, neurogenic inflammation, migraine, cluster headache and other headaches, thermal injury, circulatory shock, menopausal flushing, and asthma. CGRP receptor activation has been implicated in the pathogenesis of migraine headache (Edvinsson L. *CNS Drugs* 2001;15(10):745-53; Williamson, D. J. *Microsc. Res. Tech.* 2001, 53, 167-178.; Grant, A. D. *Brit. J. Pharmacol.* 2002, 135, 356-362.). Serum levels of CGRP are elevated during migraine (Goadsby PJ, et al. *Ann Neurol* 1990;28:183-7) and treatment with anti-migraine drugs returns CGRP levels to normal coincident with alleviation of headache (Gallai V. et al. *Cephalalgia* 1995;15: 384-90). Migraineurs exhibit elevated basal CGRP levels compared to controls (Ashina M, et al., *Pain.* 2000;86(1-2):133-8.2000). Intravenous CGRP infusion

- 3 -

produces lasting headache in migraineurs (Lassen LH, et al. *Cephalalgia*. 2002 Feb;22(1):54-61). Preclinical studies in dog and rat report that systemic CGRP blockade with the peptide antagonist CGRP(8-37) does not alter resting systemic hemodynamics nor regional blood flow (Shen, Y-T. et al, *J Pharmacol Exp Ther* 5 2001, 298, 551-8). Thus, CGRP-receptor antagonists may present a novel treatment for migraine that avoids the cardiovascular liabilities of active vasoconstriction associated with non-selective 5-HT_{1B/1D} agonists, 'triptans' (e.g., sumatriptan).

There are various *in vivo* migraine models known in the literature (see De 10 Vries, P. et al, *Eur J Pharmacol* 1999, 375, 61-74). Some electrically stimulate the trigeminal ganglion and measure dilation of the intracranial vessels which they innervate (e.g., Williamson et al. *Cephalalgia* 1997 17:518-24). Since facial arteries are also innervated by the trigeminal nerve, other models study changes in facial blood flow induced by electrical trigeminal activation (e.g., Escott et al. 15 *Brain Res* 1995 669:93). Alternatively, other peripheral nerves (e.g., saphenous) and vascular beds (e.g., abdominal blood flow) are also studied (e.g., Escott et al. *Br J Pharmacol* 1993 110, 772-6;). All models have been shown to be blocked by pretreatment with the peptide antagonist CGRP(8-37) a peptide fragment that is absent the 1st seven residues, or by a small molecule CGRP-receptor antagonist. 20 In some instances, exogenous CGRP has been used as a stimulus. However, these models are all invasive terminal procedures, and none have shown the clinically important abortive effect of reversing an established increase in artery dilation or increased blood flow using post-treatment of a CGRP-receptor antagonist. Williamson et al. *Cephalalgia* 1997 17:518-24, and Williamson et al. *Cephalalgia*. 25 1997 17:525-31: used *inter alia* i.v. CGRP as a stimulus to increase intracranial dural artery diameter in sodium pentobarb anesthetized rats employing a terminal 'intravital' procedure that involved drilling to thin the skull and the creation of a closed cranial window to visualize dural arteries. The effect was blocked by pretreatment with i.v. CGRP(8-37). Escott et al. *Brain Res* 1995 669:93; *inter* 30 *alia* drilled into the rat skull and used brain electrodes to electrically stimulate the trigeminal ganglion and measured laser Doppler facial blood flow in a terminal

- 4 -

procedure in sodium pentobarb anesthetized rats involving neuromuscular blockade, tracheal intubation and artificial ventilation. The effect was blocked by pretreatment with CGRP(8-37). Escott et al. *Br J Pharmacol* 1993 110, 772-6; *inter alia* used intradermal (i.d.) CGRP as the stimulus to increase blood flow in

5 rat abdominal skin of sodium pentobarb anesthetized animals outfitted with cannulated jugular veins for anesthetic and drug delivery. The effect was blocked by pretreatment with i.v. CGRP(8-37). Chu et al. *Neurosci Lett* 2001 310, 169-72 used *inter alia* i.d. CGRP as the stimulus in rats and measured laser Doppler changes in blood flow in the skin of the back in a terminal method using sodium

10 pentobarb anesthetized and tracheal cannulated animals; and showed pretreatment blockade by continuous release of CGRP(8-37) from subcutaneously (s.c.) implanted osmotic pumps. Hall et al *Br J Pharmacol* 1995 114, 592-7 and Hall et al *Br J Pharmacol* 1999 126, 280-4 *inter alia* used topical CGRP to increase hamster cheek pouch arteriole diameter, and i.d. CGRP to increase blood flow in

15 rat dorsal skin of sodium pentobarb anesthetized animals outfitted with cannulated jugular veins for anesthetic and drug delivery. The effect was blocked by pretreatment with i.v. CGRP(8-37). Doods et al. *Br J Pharmacol*. 2000 Feb;129(3):420-3 *inter alia* drilled into the skull of the marmoset (new world monkey) and used brain electrodes to produce electrical stimulation of the

20 trigeminal ganglion and measured facial blood flow in an invasive terminal procedure involving neuromuscular blockade and artificial ventilation of sodium pentobarbital anesthetized primates. Increase in flow was blocked by pre-treatment of a small molecule CGRP antagonist. *See also* WO 03/272252

Thus the method of the present invention procedure being *inter alia* a non-invasive survival model in primates measuring exogenous CGRP-induced changes in facial blood flow and demonstrating pre- and post-treatment effects of peptide and small molecule CGRP antagonists in spontaneously breathing isoflurane

30 anesthetized marmosets who recover from the procedure offers significant advantages.

A number of non-peptidic, small molecule CGRP-receptor antagonists have been recently reported. WO 97/09046 and equivalents disclose *inter alia* quinine and quinidine related compounds which are ligands, in particular antagonists, of CGRP-receptor. WO 98/09630 and WO 98/56779 and
 5 equivalents disclose *inter alia* variously substituted, nitrobenzamide compounds as CGRP-receptor antagonists. WO 01/32649, WO 01/49676, and WO 01/32648 and equivalents disclose *inter alia* a series of 4-oxobutanamides and related cyclopropane derivatives as CGRP-receptor antagonists. WO 00/18764, WO 98/11128 and WO 00/55154 and equivalents disclose *inter alia* benzimidazoliny
 10 piperidines as antagonists to CGRP-receptor. Unrelated to CGRP, a series of somatostatin antagonists have been disclosed in WO 99/52875 and WO 01/25228 and equivalents. *See also* U.S. 6,344,449, U.S. 6,313,097, U.S. 6,521,609, U.S. 6,552,043, US 20030181462, US20030191068 and WO 03/076432 and related applications. Thus, novel CGRP-receptor antagonists effective for the treatment
 15 of neurogenic inflammation, migraine and other disorders would be greatly advantageous.

5 Yet other embodiments of the present invention may comprise a suitable subset of an embodiment and/or aspect disclosed herein or combinations thereof.

Still yet other embodiments and aspects of the invention will be apparent according to the description provided below.

10 DETAILED DESCRIPTION OF THE INVENTION

The description of the invention herein should be construed in congruity with the laws and principals of chemical bonding. For example, it may be necessary to remove a hydrogen atom in order accommodate a substituent at any given location.

15 As used herein, "heterocyclic" or "heterocycle" includes cyclic moieties containing one or more heteroatoms, (*e.g.*, O, N or S) said heterocycles include those that are aromatic and those that are not, *i.e.*, "alicyclic", unless otherwise specified.

As used herein, the term "fused bicyclic system" when describing for
20 example a 5.6-fused bicyclic system containing 1 to 4 nitrogen atoms includes aromatic and alicyclic systems, *e.g.* indolizine, indole, isoindole, 3H-indole, indoline, indazole or benzimidazole.

If a substituent is named generically, then any and all species of that genus comprise that aspect of the invention. For example, a substituent
25 generically named as "pyrrolonyl" (the radical of "pyrrolone", a pyrrole having a carbonyl) includes pyrrol-2-onyls wherein the carbonyl is adjacent to the nitrogen and pyrrol-3-onyls wherein the carbonyl and nitrogen have an intervening methylene.

Similarly, the present invention comprises that a substituent may be
30 attached at any and all suitable points of attachment on said substituent unless otherwise specified.

- 44 -

However, it is also understood that the compounds encompassed by the present invention are those that are chemically stable, i.e., heteroalicyclic substituents of the present invention should not be attached in such a way that a heteroatom in said heteroalicyclic substituent is alpha to a point of attachment
 5 wherein said point of attachment is also a heteroatom.

An embodiment or aspect which depends from another embodiment or aspect, will describe only the variables having values or provisos that differ from the embodiment or aspect from which it depends. If for example a dependent embodiment only addresses R^2 , then the variables and provisos not related to R^2
 10 should reflect that of the embodiment from which it depends.

If a variable is quantified with a value of zero, then a bond attaching said variable should no longer be represented.

As used herein, "alkylene" means a divalent alkane, *i.e.*, an alkane having two hydrogen atoms removed from said alkane (said hydrogen removed from two
 15 different carbon atoms when said alkane contains more than one carbon atom),
e.g., $-\text{CH}_2\text{CH}_2\text{CH}_2-$.

As used herein, "alkylidene" means an alkane having two hydrogen atoms removed from one carbon atom in said alkane, *e.g.*,

20 It should be understood that the alternating double bond designations in the six-membered ring of the 5,6-membered fused structure represented in Formula (I) are relative and represent the delocalized π orbital electrons of said ring.

As used herein, "aryl" or "ar-" includes phenyl or naphthyl.

25 As used herein, "heterocyclic" or "heterocyclo" includes both heteroaryl and heteroalicyclic.

As used herein, "halo" or "halogen" includes fluoro, chloro, bromo and iodo and further means one or more of the same or different halogens may be substituted on a respective moiety.

- 45 -

Unless specified otherwise, acyclic hydrocarbons such as alkyl, alkoxy, alkenyl and alkynyl may be branched or straight chained.

It is to be understood that the present invention may include any and all possible stereoisomers, geometric isomers, diastereoisomers, enantiomers,
5 anomers and optical isomers, unless a particular description specifies otherwise.

As used herein, "Trp74", means that the 74th residue in RAMP1 is tryptophan (Mallee et al. *J Biol Chem* 2002, 277, 14294-8) incorporated by reference herein.

As used herein "anti-migraine compound" includes any compound,
10 peptide or peptide fragment (modified or unmodified) capable of reversing or attenuating CGRP-receptor mediated vasodilation, (e.g., CGRP-receptor antagonists).

As used herein "test compound" includes any compound, peptide or peptide fragment (modified or unmodified) being tested to determine if it is
15 capable of reversing or attenuating CGRP-receptor mediated vasodilation, (e.g., putative CGRP-receptor antagonists).

As used herein, "CGRP-receptor agonist" includes any compound, peptide or peptide fragment (modified or unmodified) capable of inducing CGRP-receptor mediated vasodilation particularly by example α CGRP or β CGRP; other
20 members of the calcitonin family, e.g. adrenomedullin; N-terminal CGRP fragments, e.g. CGRP(1-12) CGRP(1-15) and CGRP(1-22); C-terminal amide (NH₂) versions of CGRP e.g., CGRP(1-8+NH₂), CGRP(1-13+NH₂) or CGRP(1-14+NH₂); and non-naturally occurring CGRP analogues e.g.,
[Ala¹ ψ (CH₂NH)Cys²]hCGRP which contains a pseudopeptide bond between
25 Ala¹ and Cys². See Maggi CA, Rovero P, Giuliani S, Evangelista S, Regoli D, Meli A. 10 sodium salt; alkaline earth metal salts such as, for example, a magnesium salt and

will be continuous throughout the dosage regimen.

While dosing from 0.01 mg/kg to 30 mg/kg is envisaged for compounds
of the present invention, the dosage and dosage regimen and scheduling of a
30 compounds of the present invention must in each case be carefully adjusted,
utilizing sound professional judgment and considering the age, weight and

- 47 -

condition of the recipient, the route of administration and the nature and extent of the disease condition. In accordance with good clinical practice, it is preferred to administer the instant compounds at a concentration level which will produce effective beneficial effects without causing any harmful or untoward side effects.

SYNTHESIS

Compounds of the present invention may be synthesized according to the general schemas provided below. Variables provided in the schema below are defined in accordance with the description of compounds of the above Formula 10 unless otherwise specified. The compounds of the present invention may be prepared according to Scheme 1 or Scheme 2. It may also be possible to use variations of said schemes to prepare the compounds of the present inventions, said variations known to those of ordinary skill in the art.

15

Scheme 1. Synthesis of Formula I Compounds

The synthesis described in Scheme 1 begins with a compound of Formula 20 II, which is an α -hydroxycarboxylic acid with an appropriate hydroxyl protected terminus. Common hydroxy protecting groups (PG) include substituted benzyl group and trialkylsilyl group and their addition and removal are well known in the field. The carboxylic acid moiety of a Formula II compound is coupled with

- 48 -

an amine of formula HNR^1R^2 using standard peptide coupling reagents to form an amide of Formula III. The hydroxy protecting group is removed resulting in a Formula IV compound. This compound is then coupled with an amine of Formula VIII (see below) in a carbamate forming reaction, generating a Formula I compound. Carbamate formation is conveniently carried using phosgene, disuccinimidyl carbonate, carbonyl diimidazole or other equivalents.

Scheme 2. Synthesis of Formula I Compounds

10

The synthesis described by Scheme 2 begins with a compound of Formula V, which is an α -hydroxycarboxylic acid with a protected carboxylate terminus. The protection is generally a methyl ester, but other protecting groups such as ethyl, t-butyl, and benzyl esters may also be used. The Formula V compound is coupled with an amine of Formula VIII (see below) in a carbamate forming reaction, as described above, to generate a Formula VI compound. The Formula VI compound is converted to a free acid compound of Formula VII which is then coupled with an amine of Formula HNR^1R^2 to generate a Formula I compound.

20

Scheme 3. Synthesis of Formula I Compounds

5 The synthesis described by Scheme 3 begins with a compound of Formula VII from Scheme 2. The Formula VII compound is coupled with an alcohol, $\text{R}^4\text{-OH}$. Such ester-forming reactions are well known in the art and can be carried out, for example, with carbodiimide coupling agents such as N,N-dicyclohexylcarbodiimide. In addition, it is often advantageous, especially for

10 esters of secondary and tertiary alcohols, to include additives that accelerate acylations such as 4-dimethylaminopyridine.

Preparation of HNR^1R^2 and Formula VIII amines

 Formula VIII and HNR^1R^2 amines are commercially available, made by

15 literature methods or described herein.

**Preparation of Formula II and Formula V α -hydroxycarboxylic acid**

20

 Formula II α -hydroxycarboxylic acid and Formula V α -hydroxycarboxylic acid ester may be made by methods known to one of ordinary skill in the art or made as described in Scheme 4.

Scheme 4. Synthesis of Formula II and Formula V Compounds

- 5 The synthesis of compounds of Formula II and Formula V are described in Scheme 4. A compound of Formula X is deprotonated with a base such as diazabicycloundecene or tetramethylguanidine or other organic or inorganic bases well known in the art. An aldehyde of Formula IX is reacted with a glycine phosphonate of Formula X in a Wadsworth-Emmons coupling reaction affording
- 10 an olefin of Formula XI. The compound of Formula XI is converted to an α -ketoester of Formula XII by removal of the amino protecting group (PG) followed by hydrolysis using water either by itself or in conjunction with an acid such as hydrochloric acid, trifluoroacetic acid, or other organic or inorganic acids.

- 51 -

The α -ketoester of Formula XII can be reduced to give a compound of Formula V by an appropriate reducing agent such as sodium borohydride, sodium cyanoborohydride, hydrogen in the presence of an appropriate catalyst such as palladium on carbon, or other reducing agents well known in the art. The hydroxyl of a compound of Formula V can be protected to give an appropriate hydroxyl protected terminus of Formula XIII. Common hydroxyl protecting groups (PG) include methoxymethyl ether, benzyloxymethylether, substituted benzyl groups and trialkylsilyl group and their addition and removal are well known in the field. A compound of Formula XIII can be converted to a compound of formula II by treatment with lithium chloride, lithium hydroxide, sodium hydroxide, or other organic or inorganic bases using water or other suitable solvents using methodology well known in the art.

Compounds of Formula II and Formula V can also be prepared as described below in Scheme 5.

Scheme 5. Synthesis of Formula II and Formula V Compounds

- 52 -

A compound of Formula XIV is deprotonated with a base such as diazabicycloundecene or tetramethylguanidine or other organic or inorganic bases well known in the art. An aldehyde of Formula IX is reacted with the lactate phosphonate of Formula X in a Wadsworth-Emmons coupling reaction affording an olefin of Formula XV. The compound of Formula XV is reduced to a lactate ester of Formula V by hydrogenation of the double bond. Reduction can either result in a racemic compound using, for example, hydrogenation over palladised charcoal, or a chiral compound using a chiral catalyst such as (-)-1,2-bis-((2R,5R)-2,5-diethylphospholano)benzene(cyclooctadiene)rhodium(I) tetrafluoroborate. The hydroxyl of a compound of Formula V can be protected to give an appropriate hydroxyl protected terminus of Formula XIII. Common hydroxyl protecting groups (PG) include methoxymethyl ether, benzyloxymethylether, substituted benzyl groups and trialkylsilyl group and their addition and removal are well known in the field. A compound of Formula XIII can be converted to a compound of formula II by treatment with lithium chloride, lithium hydroxide, sodium hydroxide, or other organic or inorganic bases using water or other suitable solvents using methodology well known in the art.

Compounds of Formula XI where R^3 is an aromatic ring, can also be prepared as shown in Scheme 6.

Scheme 6. Synthesis of Formula XVII Compounds

Scheme 6 starts with an *N*-protected aminoacrylate of Formula XVI that can be coupled to a compound of Formula XVII comprising an aromatic ring to which is attached a leaving group (X) such as iodine or bromine in the presence

- 53 -

of a transition metal catalyst such as palladium (II) acetate in a non-reactive solvent with or without heating.

The syntheses of α -hydroxy carboxylic acids of Formula II and α -hydroxy carboxylic acid esters is well preceded in the literature and their
5 syntheses should be known to anyone of ordinary skill in the art.

INTERMEDIATES AND EXAMPLES

General. ^1H -NMR and ^{13}C -NMR spectra were run on a Bruker 500 or 300 MHz instrument and chemical shifts were reported in ppm (δ) with reference

20

Polyphosphoric acid (113 g) was heated to 100-110°C and stirred while 1-benzyl-piperidin-4-one (9.27 ml, 50 mmol) was added. Immediately afterwards, phenyl urea (9.55 g, 70. mmol) was added in portions small enough to avoid excessive foaming. The mixture was heated at 150-160°C overnight.
25 Water (200 mL) was then added slowly to the mixture which had been allowed to cool to 100-110°C (at lower temperatures the mixture becomes too viscous to stir). The resulting solution was neutralized with 10N NaOH to ca. pH 8, and then extracted with chloroform. The organic phase was dried over magnesium

- 54 -

sulfate and then concentrated to give the crude product which was purified by flash column chromatography on silica gel (6:4 ethyl acetate/hexanes) to give the desired product (9.0 g, 58%). Mass spec.: 308.25 (MH)⁺.

CGRP Binding Assay

Tissue Culture. SK-N-MC cells were grown at 37 °C in 5% CO₂ as a monolayer in medium consisting of MEM with Earle's salts and L-glutamine (Gibco) supplemented with 10% fetal bovine serum (Gibco).

5 *Cell Pellets.* The cells were rinsed twice with phosphate-buffered saline (155 mM NaCl, 3.3 mM Na₂HPO₄, 1.1 mM KH₂PO₄, pH 7.4), and incubated for 5-10 min. at 4 °C in hypotonic lysis buffer consisting of 10 mM Tris (pH 7.4) and 5 mM EDTA. The cells were transferred from plates to polypropylene tubes (16 x 100 mm) and homogenized using a polytron. Homogenates were centrifuged at
10 32,000 x g for 30 min. The pellets were resuspended in cold hypotonic lysis buffer with 0.1% mammalian protease inhibitor cocktail (Sigma) and assayed for protein concentration. The SK-N-MC homogenate was then aliquoted and stored at -80 °C until needed.

Radioligand Binding Assay. The compounds of invention were solubilized
15 and carried through serial dilutions using 100% DMSO. Aliquots from the compound serial dilutions were further diluted 25 fold into assay buffer (50 mM Tris-Cl pH 7.5, 5 mM MgCl₂, 0.005% Triton X-100) and transferred (volume 50 µl) into 96 well assay plates. [¹²⁵I]-CGRP (Amersham Biosciences) was diluted to 60 pM in assay buffer and a volume of 50 µl was added to each well. SK-N-MC
20 pellets were thawed, diluted in assay buffer with fresh 0.1% mammalian protease inhibitor cocktail (Sigma), and homogenized again. SK-N-MC homogenate (5 µg/well) was added in a volume of 100 µl. The assay plates were then incubated at room temperature for 2 h. Assays were stopped by addition of excess cold
25 wash buffer (20 mM Tris-Cl pH 7.5, 0.1% BSA) immediately followed by filtration over glass fiber filters (Whatman GF/B) previously soaked in 0. 5% PEI. Non-specific binding was defined with 1 µM beta-CGRP. Protein bound radioactivity was determined using a gamma or scintillation counter. The IC₅₀ was defined as the concentration of a compound of invention required to displace 50% of radioligand binding.

30 Human CGRP receptor binding affinities for Examples 1-15 were each less than 1nM.
